1 Introduction

1.1 Periodic Functions

Definition 1.1.1: Periodic Functions

A function $f(x)$ is said to be have a *period* P or to be *periodic* with period P if for all x , $f(x + P) = f(x)$ where P is a positive constant. The least value of $P > 0$ is called the *least period* or simply the *period* of $f(x)$.

Example 1.1: Some examples of periodic functions

1. $\sin x$ has periods $2\pi, 4\pi, 6\pi, \dots$ and $-\pi, -3\pi, -5\pi, \dots$ and hence the least period is 2π .
2. $\cos x$ has the least period 2π .
3. $\tan x$ has the least period π .

Some other examples:

Figure 1.1.1

1.2 Piecewise Continuous Functions

Definition 1.2.1: Piecewise Continuous Functions

A function $f(x)$ is said to be *piecewise continuous* in the interval $[a, b]$ if $f(x)$ is continuous in the interval (a, b) and has a finite number of finite discontinuities in the interval $[a, b]$.

Figure 1.2.1

The right-hand limit of $f(x)$ is often denoted by $\lim_{\epsilon \rightarrow 0} f(x + \epsilon) = f(x + 0)$, where $\epsilon > 0$.

Similarly, the left-hand limit of $f(x)$ is denoted by $\lim_{\epsilon \rightarrow 0} f(x - \epsilon) = f(x - 0)$, where $\epsilon > 0$. The values of $f(x + 0)$ and $f(x - 0)$ at the point x in (1.2.1) are as indicated.

2 Fourier Expansion

2.1 Definition and Derivation

2.1.1 Definition

Definition 2.1.1: Fourier Expansion

Let $f(x)$ be defined in the interval $(-L, L)$ and determined outside of this interval by $f(x+2L) = f(x)$, i.e. assume that $f(x)$ has the period $2L$. The *Fourier series* or *Fourier expansion* corresponding to $f(x)$ is defined to be

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left[a_n \cos \left(\frac{n\pi x}{L} \right) + b_n \sin \left(\frac{n\pi x}{L} \right) \right] \quad (1)$$

where the *Fourier coefficients* a_n and b_n are given by

$$\begin{cases} a_0 = \frac{1}{L} \int_{-L}^L f(x) dx \\ a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \left(\frac{n\pi x}{L} \right) dx \\ b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \left(\frac{n\pi x}{L} \right) dx \end{cases} \quad n = 0, 1, 2, \dots \quad (2)$$

2.1.2 Some pre-derivations

$$\begin{aligned} I &= \int_{-L}^L \sin^2 \frac{n\pi x}{L} dx \\ &= \sin \frac{n\pi x}{L} \cdot \frac{L}{n\pi} (\cos n\pi - \cos n\pi) + \frac{n\pi}{L} \cdot \frac{L}{n\pi} \int_{-L}^L \cos \frac{n\pi x}{L} \cos \frac{n\pi x}{L} dx \\ &= \int_{-L}^L \cos^2 \frac{n\pi x}{L} dx \\ &= \frac{1}{2} \int_{-L}^L \left(\cos \frac{2n\pi x}{L} + 1 \right) dx \\ &= \frac{1}{2} \int_{-L}^L \cos \frac{2n\pi x}{L} dx + \frac{1}{2} \int_{-L}^L dx \\ &= 0 + \frac{1}{2} \cdot 2L \\ &= L \end{aligned}$$

$$\begin{aligned}
I_1 &= \int_{-L}^L \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} dx \quad [m \neq 0] \\
&= \cos \frac{m\pi x}{L} \int_{-L}^L \cos \frac{n\pi x}{L} dx + \frac{m}{n} \int_{-L}^L \sin \frac{m\pi x}{L} \sin \frac{n\pi x}{L} dx \\
&= \frac{L}{n\pi} \cos \frac{m\pi x}{L} (\sin n\pi + \sin n\pi) + \frac{m}{n} I_2 \\
&= 0 + \frac{m}{n} \left[\int_{-L}^L \sin \frac{m\pi x}{L} \sin \frac{n\pi x}{L} dx \right] \\
&= \frac{m}{n} \left[\sin \frac{m\pi x}{L} \int_{-L}^L \sin \frac{n\pi x}{L} dx + \frac{m}{n} \int_{-L}^L \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} dx \right] \\
&= \frac{m}{n} \left[\frac{L}{n\pi} \sin \frac{m\pi x}{L} (-\cos n\pi + \cos n\pi) + \frac{m}{n} \right] \\
&= 0 + \frac{m^2}{n^2} I_1 \\
I_1 &= 0 = I_2
\end{aligned}$$

To summarize, we have

$$\int_{-L}^L \sin^2 \frac{n\pi x}{L} dx = \int_{-L}^L \cos^2 \frac{n\pi x}{L} dx = L \quad (3)$$

$$\int_{-L}^L \cos mx dx = \int_{-L}^L \sin mx dx = 0 \quad (4)$$

$$\int_{-L}^L \sin \frac{n\pi x}{L} \cos \frac{n\pi x}{L} dx = 0 \quad (5)$$

$$\int_{-L}^L \sin \frac{n\pi x}{L} \sin \frac{m\pi x}{L} dx = \int_{-L}^L \cos \frac{n\pi x}{L} \cos \frac{m\pi x}{L} dx = 0 \quad [m \neq n] \quad (6)$$

2.1.3 Derivation of a_0

Taking integral on both sides of (1) from $-L$ to L , we get

$$\begin{aligned}
\int_{-L}^L f(x) dx &= \frac{a_0}{2} \int_{-L}^L dx + \sum_{n=1}^{\infty} \int_{-L}^L \left[a_n \cos \frac{m\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right] dx \\
&= \frac{a_0}{2} \cdot 2L \quad [\text{All the other terms are 0 according to equation (4)}]
\end{aligned}$$

$$\boxed{a_0 = \frac{1}{L} \int_{-L}^L f(x) dx}$$

2.1.4 Derivation of a_n

Multiplying both sides of (1) by $\cos \frac{m\pi x}{L}$ and integrating from $-L$ to L , we get

$$\begin{aligned}
\int_{-L}^L f(x) \cos \frac{m\pi x}{L} dx &= \frac{a_0}{2} \int_{-L}^L \cos \frac{m\pi x}{L} dx \\
&\quad + \sum_{n=1}^{\infty} \int_{-L}^L \left[a_n \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \cos \frac{m\pi x}{L} \right] dx \\
&= a_n \int_{-L}^L \cos^2 \frac{m\pi x}{L} dx \\
&= a_n \cdot L \quad [\text{All the other terms are 0 according to equation (2)}]
\end{aligned}$$

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{m\pi x}{L} dx$$

2.1.5 Derivation of b_n

Multiplying both sides of (1) by $\sin \frac{m\pi x}{L}$ and integrating from $-L$ to L , we get

$$\begin{aligned}
\int_{-L}^L f(x) \sin \frac{m\pi x}{L} dx &= \frac{a_0}{2} \int_{-L}^L \sin \frac{m\pi x}{L} dx \\
&\quad + \sum_{n=1}^{\infty} \int_{-L}^L \left[a_n \sin \frac{m\pi x}{L} \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \sin \frac{m\pi x}{L} \right] dx \\
&= a_n \int_{-L}^L \sin^2 \frac{m\pi x}{L} dx \\
&= a_n \cdot L \quad [\text{All the other terms are 0 according to equation (2)}]
\end{aligned}$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{m\pi x}{L} dx$$

Example 2.1: Obtain the F.S for $f(x) = x - x^2$ in the interval $(-\pi, \pi)$ and hence evaluate

$$\frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \cdots$$

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} (a_n \cos nx + b_n \sin nx)$$

where

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) dx = \frac{1}{\pi} \left[\frac{x^2}{2} - \frac{x^3}{3} \right]_{-\pi}^{\pi} = -\frac{2\pi^2}{3}$$

$$\begin{aligned}
a_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) \cos nx dx \\
&= \frac{1}{\pi} \left[\int_{-\pi}^{\pi} x \cos nx dx - \int_{-\pi}^{\pi} x^2 \cos nx dx \right] \\
&= -\frac{2}{\pi} \int_0^{\pi} x^2 \cos nx dx \\
&= -\frac{2}{\pi} \left[\frac{x^2}{n} \sin nx - \frac{2}{n} \int x \sin nx dx \right]_0^{\pi} \\
&= \frac{4}{n\pi} \left[-\frac{x}{n} \cos nx + \frac{1}{n^2} \sin nx \right]_0^{\pi} \\
&= -\frac{4}{n^2} (-1)^n
\end{aligned}$$

$$\begin{aligned}
b_n &= \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx \\
&= \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) \cos nx dx \\
&= \frac{1}{\pi} \left[\int_{-\pi}^{\pi} x \sin nx dx - \int_{-\pi}^{\pi} x^2 \sin nx dx \right] \\
&= \frac{2}{\pi} \int_0^{\pi} x \sin nx dx \\
&= \frac{2}{\pi} \left[-\frac{x}{n} \cos nx + \frac{1}{n^2} \sin nx \right]_0^{\pi} \\
&= -\frac{2}{n} (-1)^n
\end{aligned}$$

$$\therefore f(x) = -\frac{\pi^2}{3} - \sum_{n=1}^{\infty} \left(\frac{4}{n^2} (-1)^n \cos nx + \frac{2}{n} (-1)^n \sin nx \right)$$

For $x = 0$, we get

$$0 = -\frac{\pi^2}{3} - \sum_{n=1}^{\infty} \frac{4}{n^2} (-1)^n$$

$$\frac{\pi^2}{12} = -\sum_{n=1}^{\infty} (-1)^n \frac{1}{n^2}$$

$$\boxed{\therefore 1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \cdots = \frac{\pi^2}{12}}$$
