1 Introduction

1.1 Periodic Functions

Definition 1.1.1: Periodic Functions

A function f(x) is said to be have a *period* P or to be *periodic* with period P if for all x, f(x+P)=f(x) where P is a positive constant. The least value of P>0 is called the *least period* or simply the *period* of f(x).

Example 1.1: Some examples of periodic functions

- 1. $\sin x$ has periods $2\pi, 4\pi, 6\pi, \cdots$ and $-\pi, -3\pi, -5\pi, \cdots$ and hence the least period is 2π .
- 2. $\cos x$ has the least period 2π .
- 3. $\tan x$ has the least period π .

Some other examples:

1.2 Piecewise Continuous Functions

Definition 1.2.1: Piecewise Continuous Functions

A function f(x) is said to be *piecewise continuous* in the interval [a, b] if f(x) is continuous in the interval (a, b) and has a finite number of finite discontinuities in the interval [a, b].

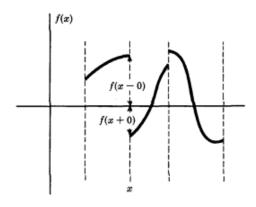

Figure 1.2.1

The right-hand limit of f(x) is often denoted by $\lim_{\epsilon \to 0} f(x+\epsilon) = f(x+0)$, where $\epsilon > 0$.

Similarly, the left-hand limit of f(x) is denoted by $\lim_{\epsilon \to 0} f(x - \epsilon) = f(x - 0)$, where $\epsilon > 0$. The values of f(x + 0) and f(x - 0) at the point x in (1.2.1) are as indicated.

2 Fourier Expansion

2.1 Definition and Derivation

2.1.1 Definition

Definition 2.1.1: Fourier Expansion

Let f(x) be defined in the interval (-L, L) and determined outside of this interval by f(x+2L) = f(x), i.e. assume that f(x) has the period 2L. The Fourier series or Fourier expansion corresponding to f(x) is defined to be

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left[a_n \cos\left(\frac{n\pi x}{L}\right) + b_n \sin\left(\frac{n\pi x}{L}\right) \right]$$
 (1)

where the Fourier coefficients a_n and b_n are given by

$$\begin{cases} a_0 = \frac{1}{L} \int_{-L}^{L} f(x) dx \\ a_n = \frac{1}{L} \int_{-L}^{L} f(x) \cos\left(\frac{n\pi x}{L}\right) dx & n = 0, 1, 2, \dots \\ b_n = \frac{1}{L} \int_{-L}^{L} f(x) \sin\left(\frac{n\pi x}{L}\right) dx \end{cases}$$
 (2)

2.1.2 Some pre-derivations

$$I = \int_{-L}^{L} \sin^2 \frac{n\pi x}{L} dx$$

$$= \sin \frac{n\pi x}{L} \cdot \frac{L}{n\pi} (\cos n\pi - \cos n\pi) + \frac{n\pi}{L} \cdot \frac{L}{n\pi} \int_{-L}^{L} \cos \frac{n\pi x}{L} \cos \frac{n\pi x}{L} dx$$

$$= \int_{-L}^{L} \cos^2 \frac{n\pi x}{L} dx$$

$$= \frac{1}{2} \int_{-L}^{L} \left(\cos \frac{2n\pi x}{L} + 1 \right) dx$$

$$= \frac{1}{2} \int_{-L}^{L} \cos \frac{2n\pi x}{L} dx + \frac{1}{2} \int_{-L}^{L} dx$$

$$= 0 + \frac{1}{2} \cdot 2L$$

$$= L$$

$$I_{1} = \int_{-L}^{L} \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} dx \qquad [m \neq 0]$$

$$= \cos \frac{m\pi x}{L} \int_{-L}^{L} \cos \frac{n\pi x}{L} dx + \frac{m}{n} \int_{-L}^{L} \sin \frac{m\pi x}{L} \sin \frac{n\pi x}{L} dx$$

$$= \frac{L}{n\pi} \cos \frac{m\pi x}{L} (\sin n\pi + \sin n\pi) + \frac{m}{n} I_{2}$$

$$= 0 + \frac{m}{n} \left[\int_{-L}^{L} \sin \frac{m\pi x}{L} \sin \frac{n\pi x}{L} dx \right]$$

$$= \frac{m}{n} \left[\sin \frac{m\pi x}{L} \int_{-L}^{L} \sin \frac{n\pi x}{L} dx + \frac{m}{n} \int_{-L}^{L} \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} dx \right]$$

$$= \frac{m}{n} \left[\frac{L}{n\pi} \sin \frac{m\pi x}{L} (-\cos n\pi + \cos n\pi) + \frac{m}{n} \right]$$

$$= 0 + \frac{m^{2}}{n^{2}} I_{1}$$

$$I_{1} = 0 = I_{2}$$

To summarize, we have

$$\int_{-L}^{L} \sin^2 \frac{n\pi x}{L} \, dx = \int_{-L}^{L} \cos^2 \frac{n\pi x}{L} \, dx = L \tag{3}$$

$$\int_{-L}^{L} \cos mx \, dx = \int_{-L}^{L} \sin mx \, dx = 0 \tag{4}$$

$$\int_{-L}^{L} \sin \frac{n\pi x}{L} \cos \frac{n\pi x}{L} \, dx = 0 \tag{5}$$

$$\int_{-L}^{L} \sin \frac{n\pi x}{L} \sin \frac{m\pi x}{L} dx = \int_{-L}^{L} \cos \frac{n\pi x}{L} \cos \frac{m\pi x}{L} dx = 0 \qquad [m \neq n]$$
 (6)

2.1.3 Derivation of a_0

Taking integral on both sides of (1) from -L to L, we get

$$\int_{-L}^{L} f(x) dx = \frac{a_0}{2} \int_{-L}^{L} dx + \sum_{n=1}^{\infty} \int_{-L}^{L} \left[a_n \cos \frac{m\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right] dx$$

$$= \frac{a_0}{2} \cdot 2L \qquad [All the other terms are 0 according to equation (4)]$$

$$a_0 = \frac{1}{L} \int_{-L}^{L} f(x) \, dx$$

2.1.4 Derivation of a_n

Multiplying both sides of (1) by $\cos \frac{m\pi x}{L}$ and integrating from -L to L, we get

$$\int_{-L}^{L} f(x) \cos \frac{m\pi x}{L} dx = \frac{a_0}{2} \int_{-L}^{L} \cos \frac{m\pi x}{L} dx$$

$$+ \sum_{n=1}^{\infty} \int_{-L}^{L} \left[a_n \cos \frac{m\pi x}{L} \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \cos \frac{m\pi x}{L} \right] dx$$

$$= a_n \int_{-L}^{L} \cos^2 \frac{m\pi x}{L} dx$$

$$= a_n \cdot L \qquad [All the other terms are 0 according to equation (2)]$$

$$a_n = \frac{1}{L} \int_{-L}^{L} f(x) \cos \frac{m\pi x}{L} dx$$

2.1.5 Derivation of b_n

Multiplying both sides of (1) by $\sin \frac{m\pi x}{L}$ and integrating from -L to L, we get

$$\int_{-L}^{L} f(x) \sin \frac{m\pi x}{L} dx = \frac{a_0}{2} \int_{-L}^{L} \sin \frac{m\pi x}{L} dx$$

$$+ \sum_{n=1}^{\infty} \int_{-L}^{L} \left[a_n \sin \frac{m\pi x}{L} \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \sin \frac{m\pi x}{L} \right] dx$$

$$= a_n \int_{-L}^{L} \sin^2 \frac{m\pi x}{L} dx$$

$$= a_n \cdot L \qquad [All the other terms are 0 according to equation (2)]$$

$$b_n = \frac{1}{L} \int_{-L}^{L} f(x) \sin \frac{m\pi x}{L} dx$$

2.2 Examples

Example 2.1: Obtain the fourier series for $f(x)=x-x^2$ in the interval $(-\pi,\pi)$ and hence evaluate

$$\frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \cdots$$

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos nx + b_n \sin nx \right)$$

where

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) dx = \frac{1}{\pi} \left[\frac{x^2}{2} - \frac{x^3}{3} \right]_{-\pi}^{\pi} = -\frac{2\pi^2}{3}$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx = \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) \cos nx dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{\pi} x \cos nx \, dx - \int_{-\pi}^{\pi} x^2 \cos nx \, dx \right]$$

$$= -\frac{2}{\pi} \int_{0}^{\pi} x^2 \cos nx \, dx$$

$$= -\frac{2}{\pi} \left[\frac{x^2}{n} \sin nx - \frac{2}{n} \int x \sin nx \, dx \right]_{0}^{\pi}$$

$$= \frac{4}{n\pi} \left[-\frac{x}{n} \cos nx + \frac{1}{n^2} \sin nx \right]_{0}^{\pi}$$

$$= -\frac{4}{n^2} (-1)^n$$

$$b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx \, dx$$

$$= \frac{1}{\pi} \int_{-\pi}^{\pi} (x - x^2) \cos nx \, dx$$

$$= \frac{1}{\pi} \left[\int_{-\pi}^{\pi} x \sin nx \, dx - \int_{-\pi}^{\pi} x^2 \sin nx \, dx \right]$$

$$= \frac{2}{\pi} \int_{0}^{\pi} x \sin nx \, dx$$

$$= \frac{2}{\pi} \left[-\frac{x}{n} \cos nx + \frac{1}{n^2} \sin nx \right]_{0}^{\pi}$$

$$= -\frac{2}{n} (-1)^n$$

$$\therefore f(x) = -\frac{\pi^2}{3} - \sum_{n=1}^{\infty} \left(\frac{4}{n^2} (-1)^n \cos nx + \frac{2}{n} (-1)^n \sin nx \right)$$

For x = 0, we get

$$0 = -\frac{\pi^2}{3} - \sum_{n=1}^{\infty} \frac{4}{n^2} (-1)^n$$
$$\frac{\pi^2}{12} = -\sum_{n=1}^{\infty} (-1)^n \frac{1}{n^2}$$
$$\therefore 1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots = \frac{\pi^2}{12}$$

Example 2.2: Find a fourier series to represent the function $f(x) = e^x$ for $-\pi < x < \pi$ and hence derive a series for $\frac{\pi}{\sinh \pi}$

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos nx + b_n \sin nx \right)$$

where

$$a_0 = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) dx = \frac{1}{\pi} \int_{-\pi}^{\pi} e^x dx = \frac{1}{\pi} e^x \Big|_{-\pi} = \frac{e^{\pi} - e^{-\pi}}{\pi} = \frac{2 \sinh x}{\pi}$$

$$a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} e^x \cos nx \, dx$$

$$= \frac{1}{\pi} \left[e^x \frac{\sin nx}{n} - \frac{1}{n} \int e^x \sin nx \, dx \right]_{-\pi}^{\pi}$$

$$= -\frac{1}{n\pi} \left[-e^x \frac{\cos nx}{n} + \frac{1}{n} \int e^x \cos nx \, dx \right]_{-\pi}^{\pi}$$

$$a_n \left(1 + \frac{1}{n^2} \right) = \frac{(-1)^n}{n^2 \pi} \left(e^{\pi} - e^{-\pi} \right)$$

$$a_n = \frac{(-1)^n}{n^2 \pi} \left(e^{\pi} - e^{-\pi} \right) \left(1 + \frac{1}{n^2} \right)^{-1}$$

$$a_n = 2 \frac{(-1)^n}{n^2 \pi} \sinh x \left(1 + \frac{1}{n^2} \right)^{-1}$$

$$b_{n} = \frac{1}{\pi} \int_{-\pi}^{\pi} e^{x} \sin nx \, dx$$

$$= \frac{1}{\pi} \left[-e^{x} \frac{\cos nx}{n} + \frac{1}{n} \int e^{x} \cos nx \, dx \right]_{-\pi}^{\pi}$$

$$= \frac{1}{\pi} \left[-e^{x} \frac{\cos nx}{n} + \frac{1}{n} \left\{ e^{x} \frac{\sin nx}{n} - \frac{1}{n} \int e^{x} \sin nx \, dx \right\} \right]_{-\pi}^{\pi}$$

$$= \frac{1}{\pi} \left[-e^{x} \frac{\cos nx}{n} - \frac{1}{n^{2}} \int e^{x} \sin nx \, dx \right]$$

$$b_{n} = -\frac{(-1)^{n}}{n\pi} \left(e^{\pi} - e^{-\pi} \right) \left(1 + \frac{1}{n^{2}} \right)^{-1}$$

$$b_{n} = -2 \frac{(-1)^{n}}{n\pi} \sinh x \left(1 + \frac{1}{n^{2}} \right)^{-1}$$

$$f(x) = e^x = 2 \frac{\sinh x}{\pi} \left[\frac{1}{2} + \sum_{n=1}^{\infty} \left(1 + \frac{1}{n^2} \right)^{-1} \frac{(-1)^n}{n} \left(\frac{1}{n} \cos nx - \sin nx \right) \right]$$

For x = 0, we get

$$\frac{\pi}{\sinh x} = 1 + 2\sum_{n=1}^{\infty} \left(1 + \frac{1}{n^2}\right)^{-1} \frac{(-1)^n}{n^2}$$
$$= 1 + 2\sum_{n=1}^{\infty} \frac{(-1)^n}{n^2 + 1}$$

$$\frac{\pi}{\sinh x} = 1 + 2\left(-\frac{1}{2} + \frac{1}{5} - \frac{1}{10} + \cdots\right)$$

3 Fourier Integral

3.1 From Fourier Series to Fourier Integral

Fourier series were used to represent a function f defined on the finite interval (-L, L) or (0, L). It converged to f and to its periodic extension. In this sense, Fourier series is assosiated with periodic functions.

Fourier integral represents a certain type of non-periodic functions that are defined on $(-\infty, \infty)$ or $(0, \infty)$.

3.1.1 Derivation

Let a function f be defined on (-L, L). The fourier series of the function is then

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right)$$
 (7)

where the coefficients are given by

$$a_0 = \frac{1}{L} \int_{-L}^{L} f(x) dx$$

$$a_n = \frac{1}{L} \int_{-L}^{L} f(x) \cos \frac{n\pi x}{L} dx$$

$$b_n = \frac{1}{L} \int_{-L}^{L} f(x) \sin \frac{n\pi x}{L} dx$$

Now, let
$$a_n = \frac{n\pi}{L}$$
,
then $\Delta \alpha = \alpha_{n+1} - \alpha_n = \frac{\pi}{L}$

So, we get

$$df(x) = \frac{1}{2\pi} \left(\int_{-L}^{L} f(t) dt \right) \Delta \alpha + \frac{1}{\pi} \sum_{n=1}^{\infty} \left[\left(\int_{-L}^{L} f(t) \cos \alpha_n t dt \right) \cos \alpha_n x + \left(\int_{-L}^{L} f(t) \sin \alpha_n t dt \right) \sin \alpha_n x \right] \Delta \alpha$$
(8)

We now expand the interval (-L, L) by taking $L \to \infty$, which implies that $\Delta \alpha \to 0$. Consequently, we get

$$\lim_{\Delta\alpha \to 0} \sum_{n=1}^{\infty} F(\alpha_n) \Delta\alpha \to \int_0^{\infty} F(\alpha) \, d\alpha \tag{9}$$

Thus, the limit of the first term in the Fourier series $\int_{-L}^{L} f(t) dt$ vanishes, and the limit of the sum becomes

$$f(x) = \frac{1}{\pi} \int_0^\infty \left[\left(\int_{-\infty}^\infty f(t) \cos \alpha t \, dt \right) \cos \alpha x + \left(\int_{-\infty}^\infty f(t) \sin \alpha t \, dt \right) \sin \alpha x \right] d\alpha \qquad (10)$$

This is the Fourier integral of f on the interval $(-\infty, \infty)$.
